Since artificial intelligence (AI) is still a relatively new concept, there is not a framework for what AI should include or be used for. As AI is developed, more ethical and moral questions arise. Burciaga says, “Responsible AI can’t be an afterthought or a pretense. It has to be built into every aspect of how you develop and deploy your AI.” According to Burciaga, the framework for responsible AI must be accountable, impartial, resilient, transparent, secure, and governed. He also recommends creating an “AI ethics board” to ensure the AI is responsible. The ethics board can ask questions to find out if the AI is ethical, free from bias, necessary, etc. The framework may not be implemented all at once, but should be refined. As of now, different businesses and government organizations use different frameworks to evaluate their AI. Each organization may also use different criteria for what is moral or ethical. By coming up with one framework, there will be more oversight in the development of AI.
